# How light is recorded

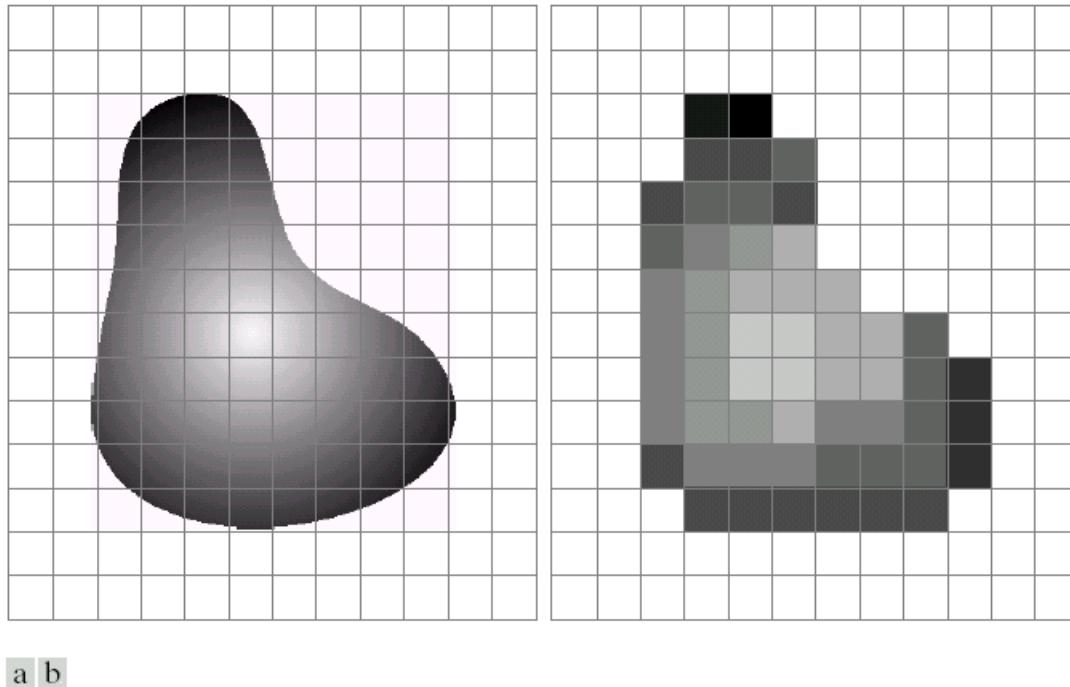

# Digital camera

A digital camera replaces film with a sensor array

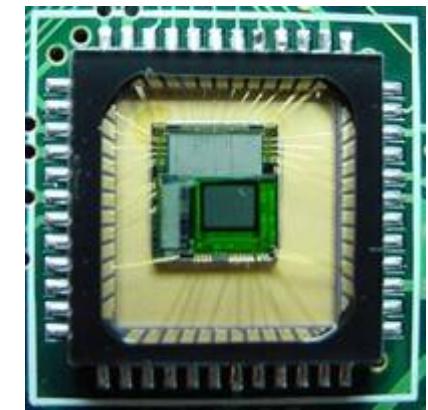

- Each cell in the array is light-sensitive diode that converts photons to electrons
- Two common types: Charge Coupled Device (CCD) and CMOS
- <http://electronics.howstuffworks.com/digital-camera.htm>

# Sensor Array

- What determines a pixel's intensity?
- What can we infer about the scene from pixel intensities?

# How does a pixel get its value?

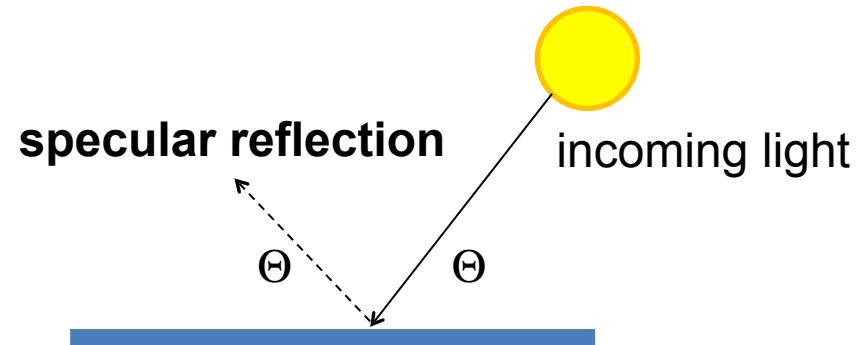

# How does a pixel get its value?

- Major factors
  - Illumination strength and direction
  - Surface geometry
  - Surface material
  - Nearby surfaces
  - Camera gain/exposure

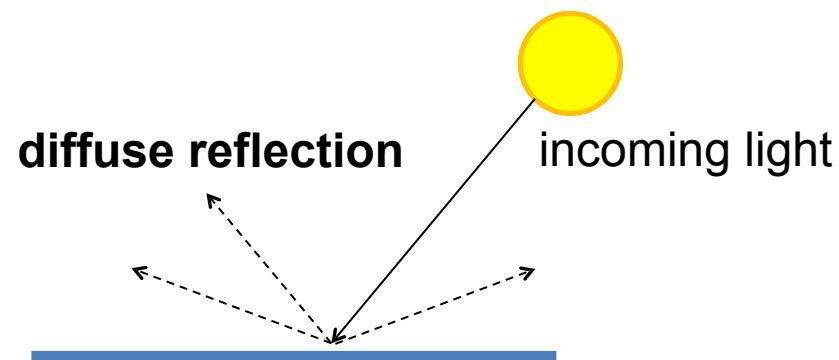

# Basic models of reflection

- Specular: light bounces off at the incident angle
  - E.g., mirror

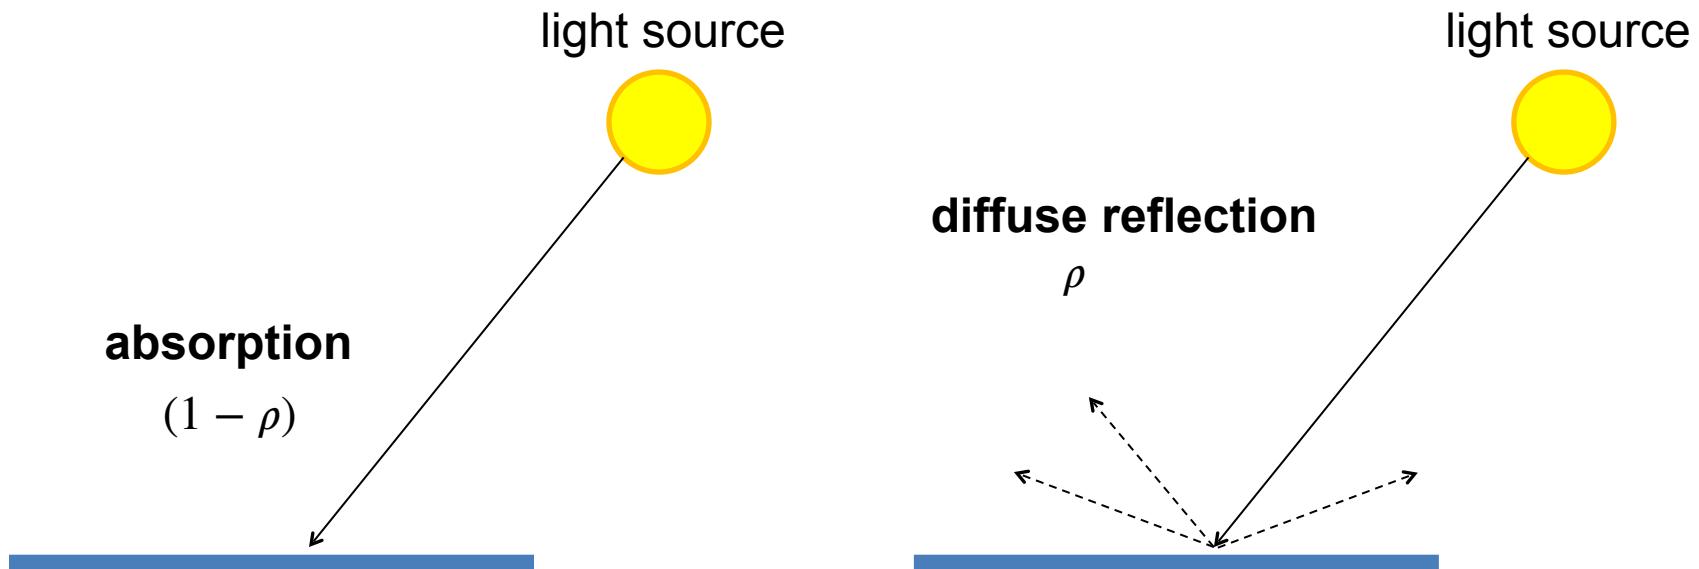

- Diffuse: light scatters in all directions
  - E.g., brick, cloth, rough wood

# Lambertian reflectance model

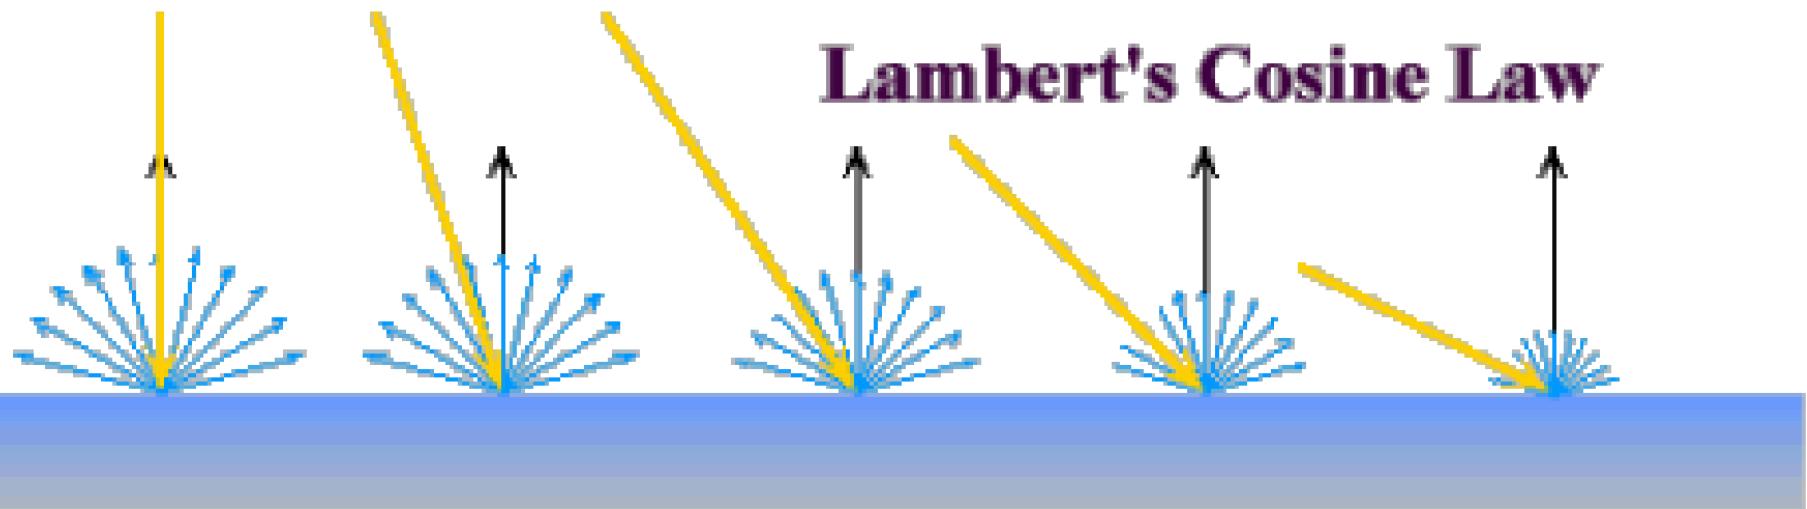

- Some light is absorbed (function of albedo  $\rho$ )
- Remaining light is scattered (diffuse reflection)
- Examples: soft cloth, concrete, matte paints

# Diffuse reflection: Lambert's cosine law

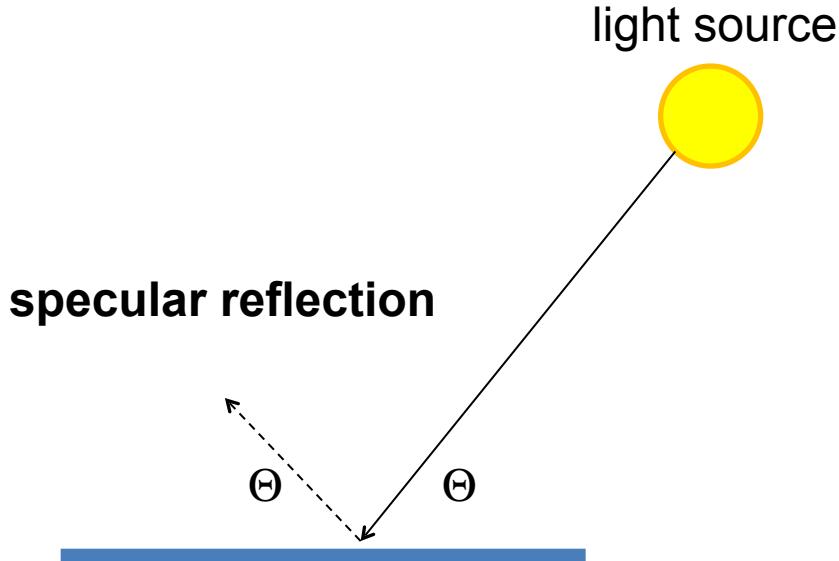

Intensity does *not* depend on viewer angle.

- Amount of reflected light proportional to  $\cos(\theta)$
- Visible solid angle also proportional to  $\cos(\theta)$

# Specular Reflection

- Reflected direction depends on light orientation and surface normal
  - E.g., mirrors are fully specular
  - Most surfaces can be modeled with a mixture of diffuse and specular components

Flickr, by suzysputnik

Flickr, by piratejohnny

# Most surfaces have both specular and diffuse components

- Specularity = spot where specular reflection dominates (typically reflects light source)

Photo: northcountryhardwoodfloors.com

Typically, specular component is small

# Intensity and Surface Orientation

Intensity depends on illumination angle because less light comes in at oblique angles.

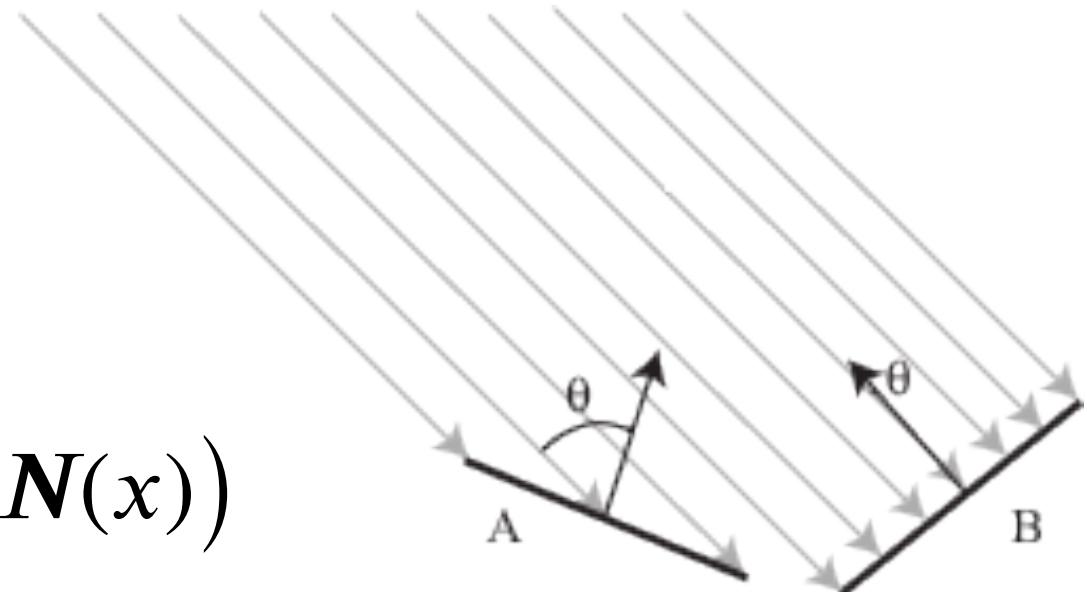

$\rho$  = albedo

$S$  = directional source

$N$  = surface normal

$I$  = reflected intensity

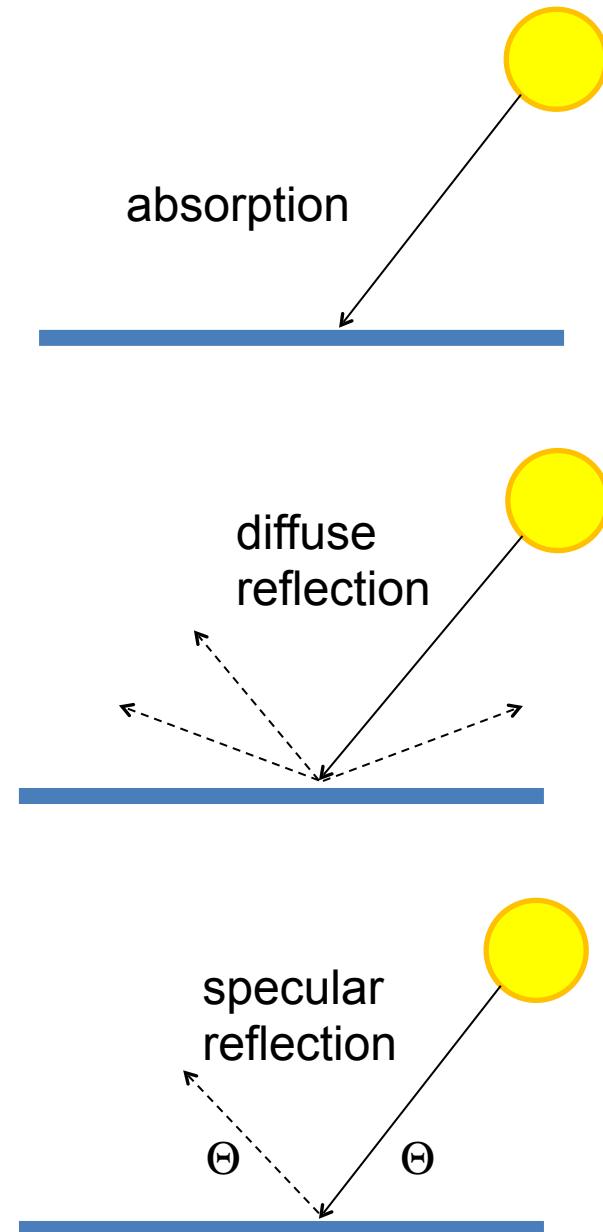

$$I(x) = \rho(x)(S \cdot N(x))$$

# Recap

- When light hits a typical surface
  - Some light is absorbed ( $1-\rho$ )
    - More absorbed for low albedos
  - Some light is reflected diffusely
    - Independent of viewing direction
  - Some light is reflected specularly
    - Light bounces off (like a mirror), depends on viewing direction

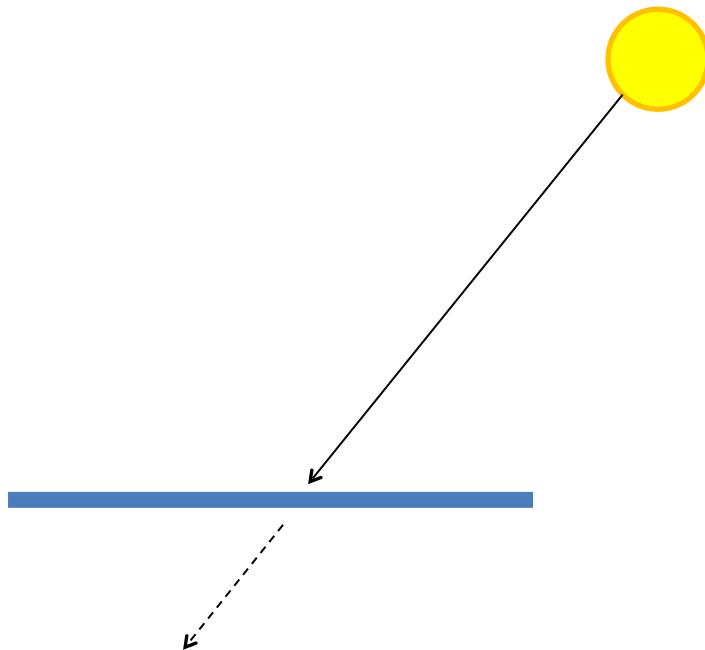

# Other possible effects

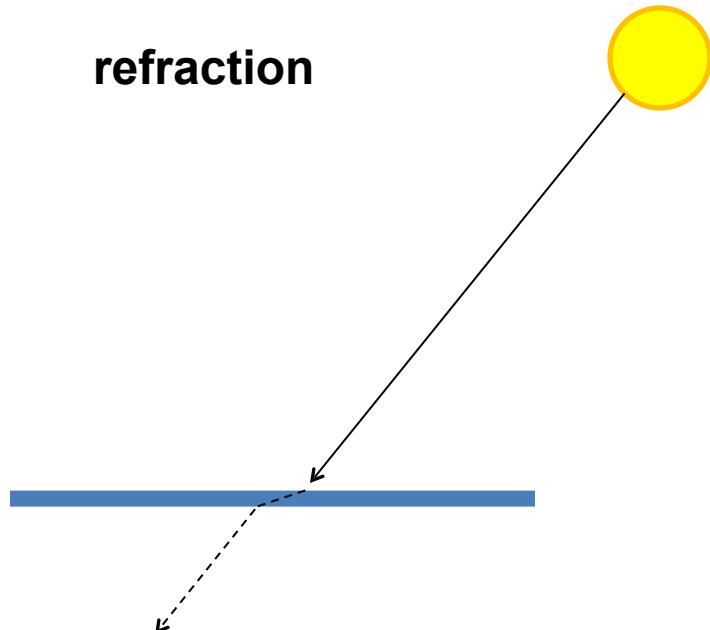

**transparency**

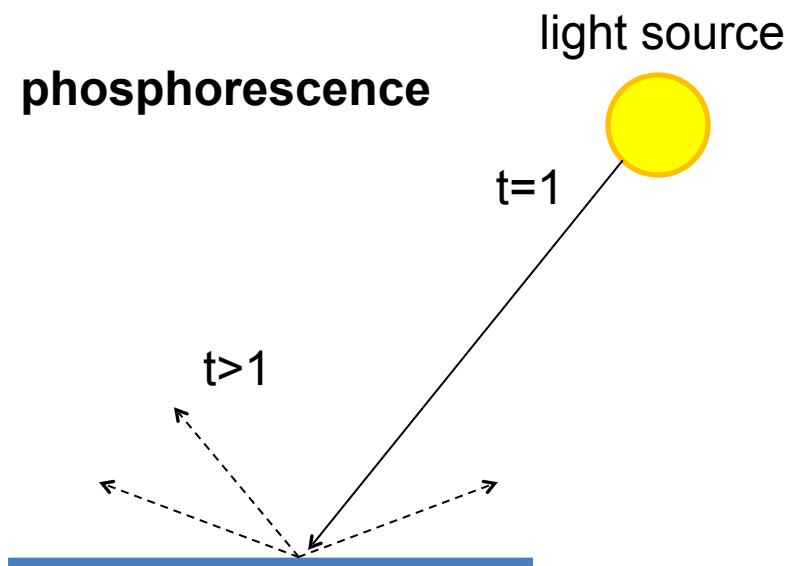

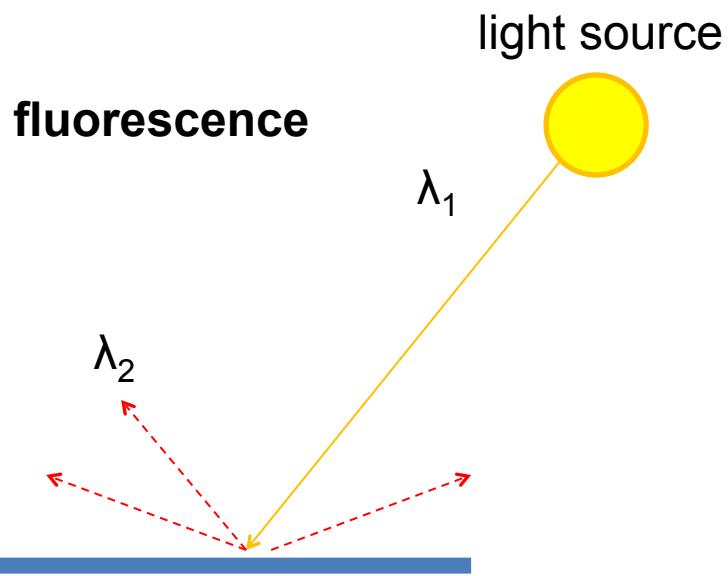

**light source**

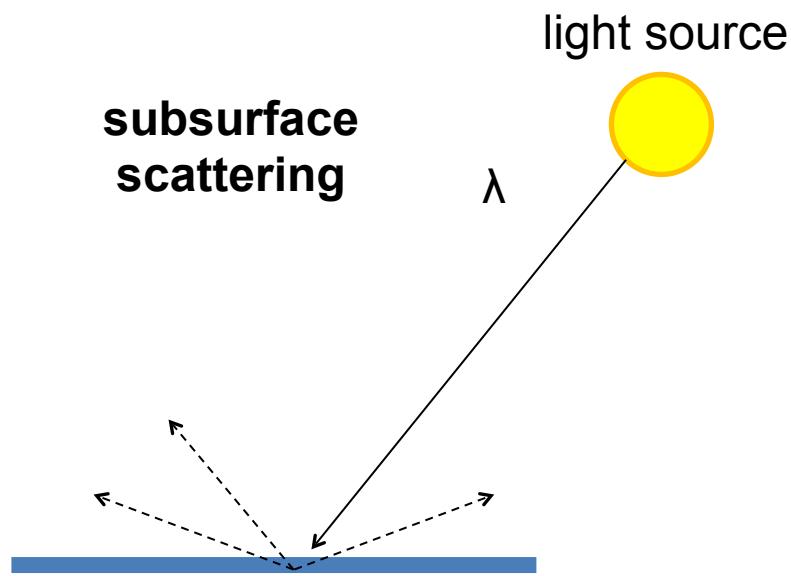

**refraction**

**light source**

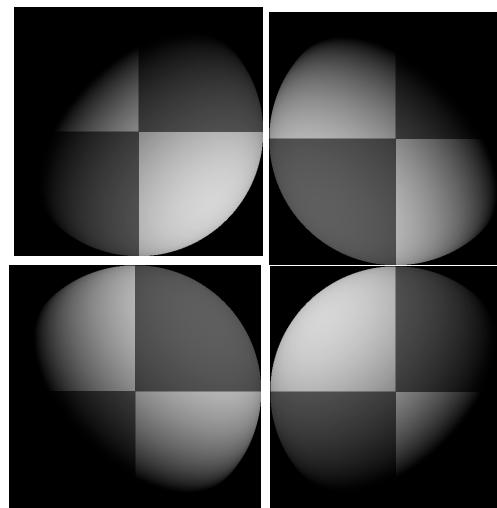

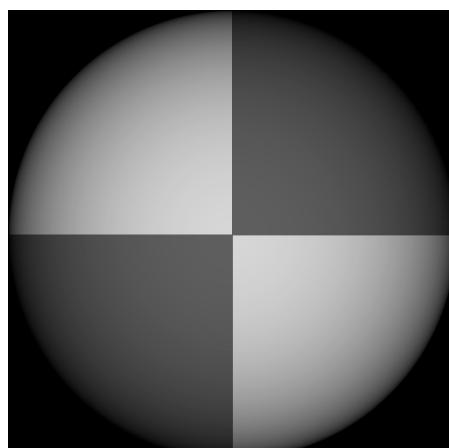

**subsurface  
scattering**

light source

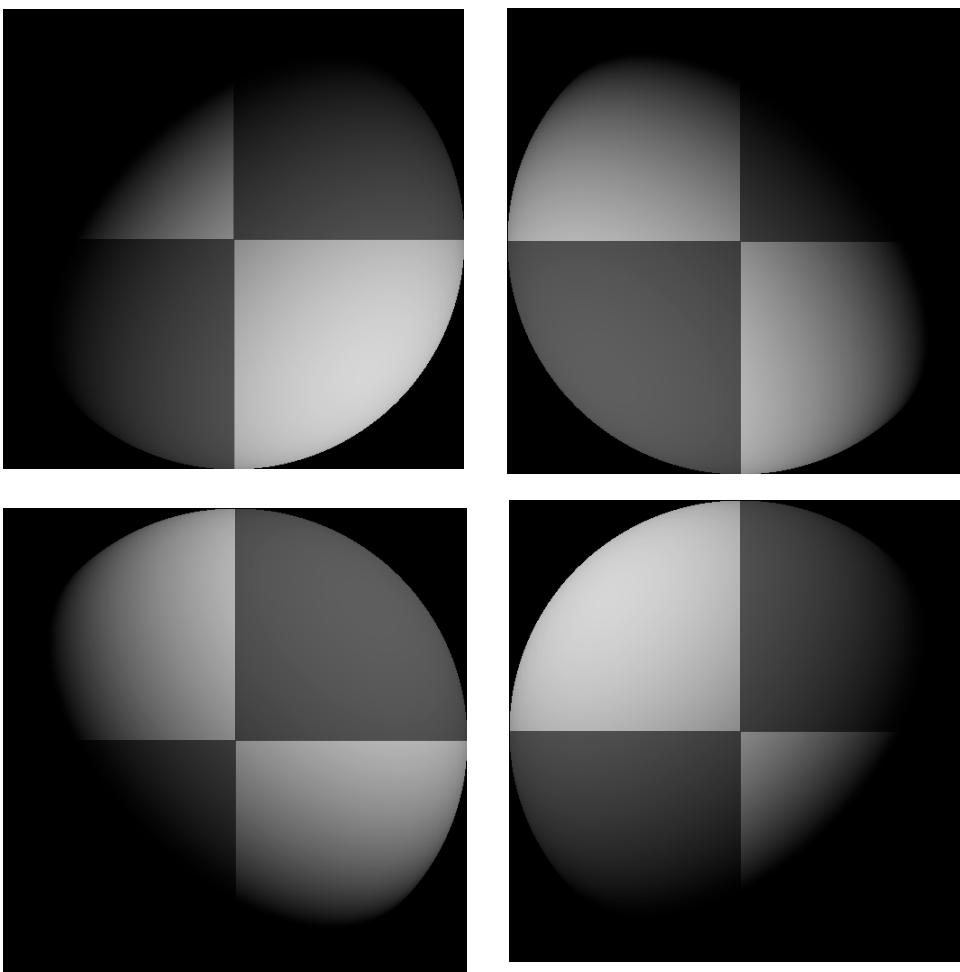

$\lambda$

# Application: photometric stereo

- Assume:
  - a set of point sources that are infinitely distant
  - a set of pictures of an object, obtained in exactly the same camera/object configuration but using different sources
  - A Lambertian object (or the specular component has been identified and removed)

Photometric stereo  
slides by Forsyth

Each image is:

$$I_i(x) = \langle S_i \cdot (\rho(x)N(x)) \rangle$$

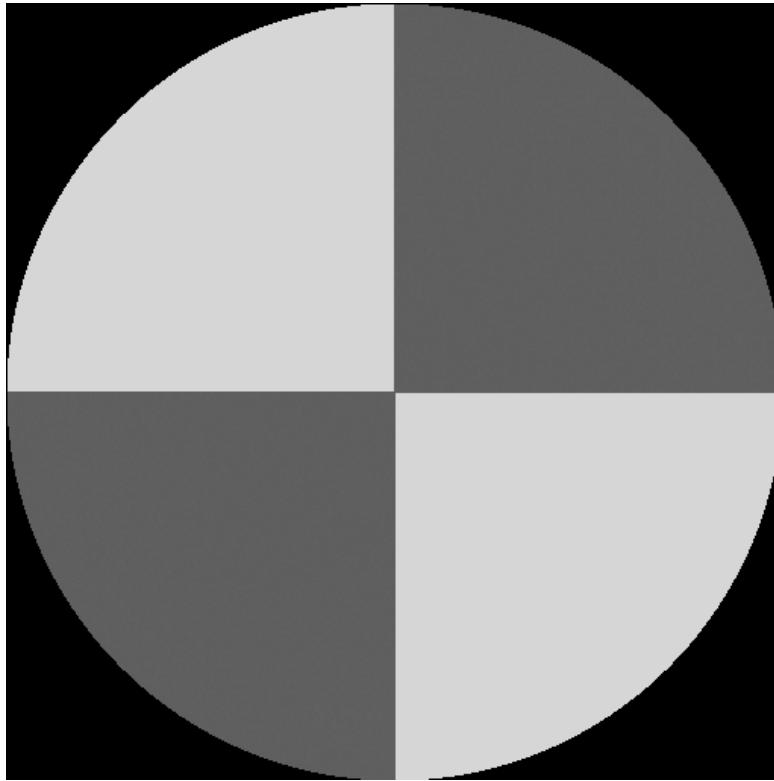

Intensity for pixel  $x$

Source  $i$  direction and strength

So if we have enough images with known sources, we can solve for

$$B(x) = \rho(x)N(x)$$

albedo times 3D normal vector

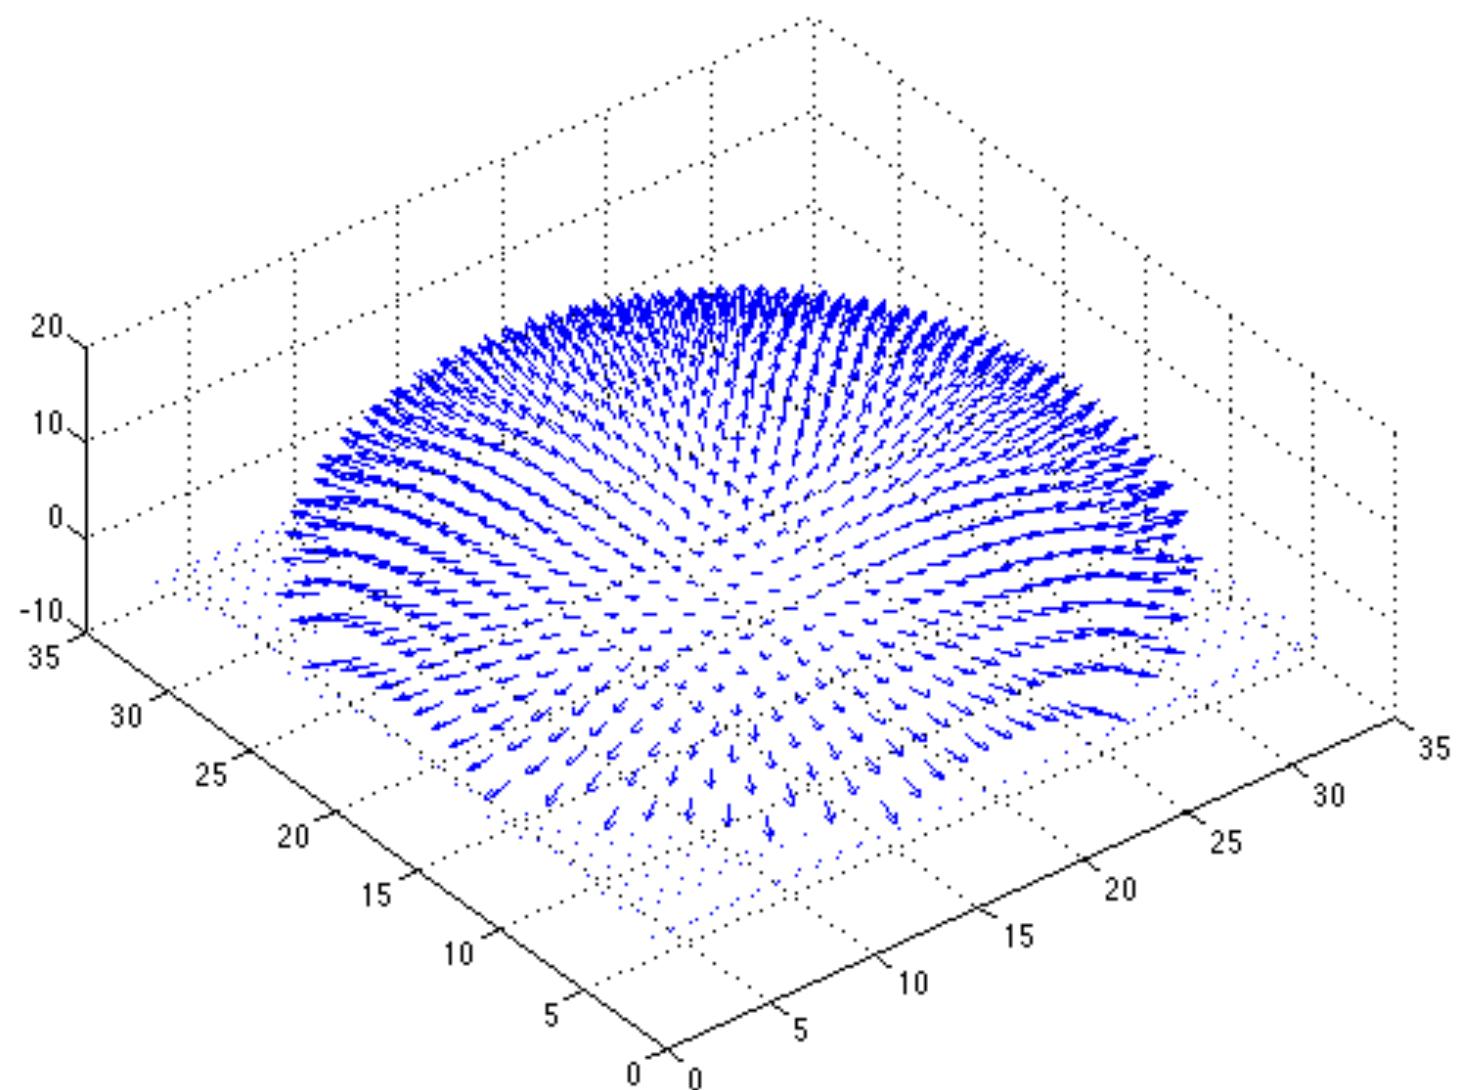

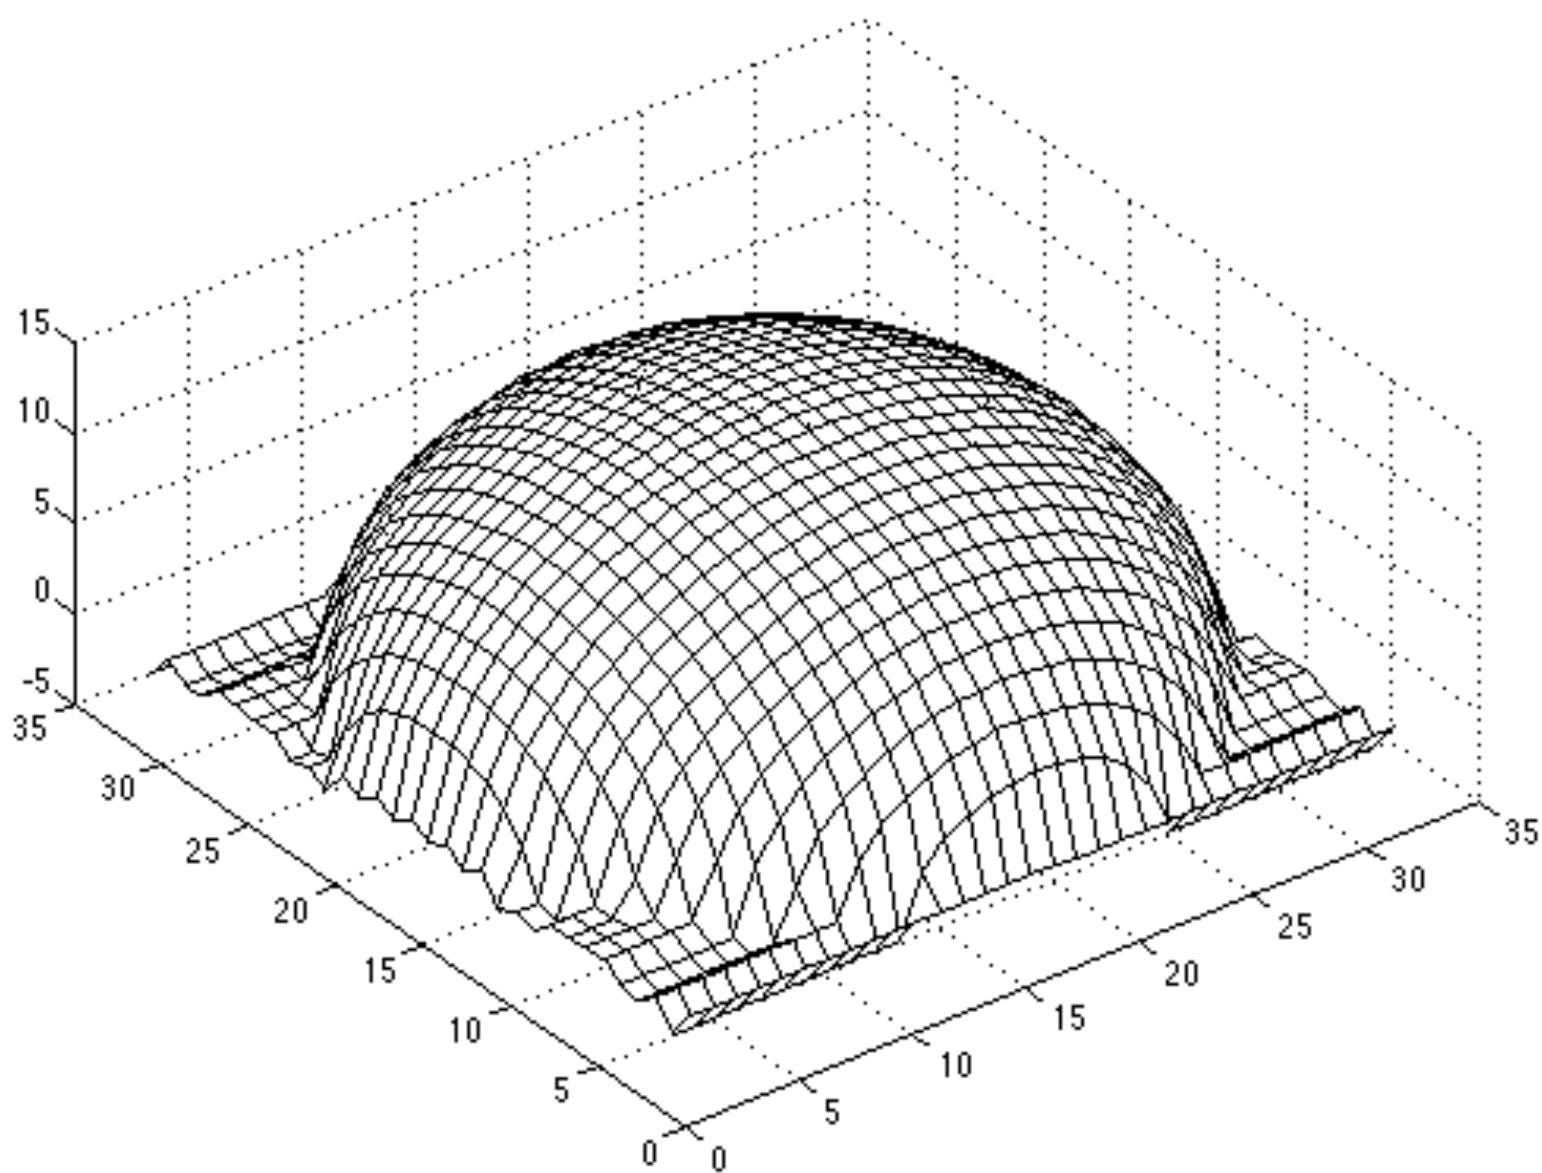

$$\mathbf{B}(x) = \rho(x) \mathbf{N}(x)$$

And the albedo (shown here) is given by:

$$\rho(x) = \sqrt{\mathbf{B}(x) \cdot \mathbf{B}(x)}$$

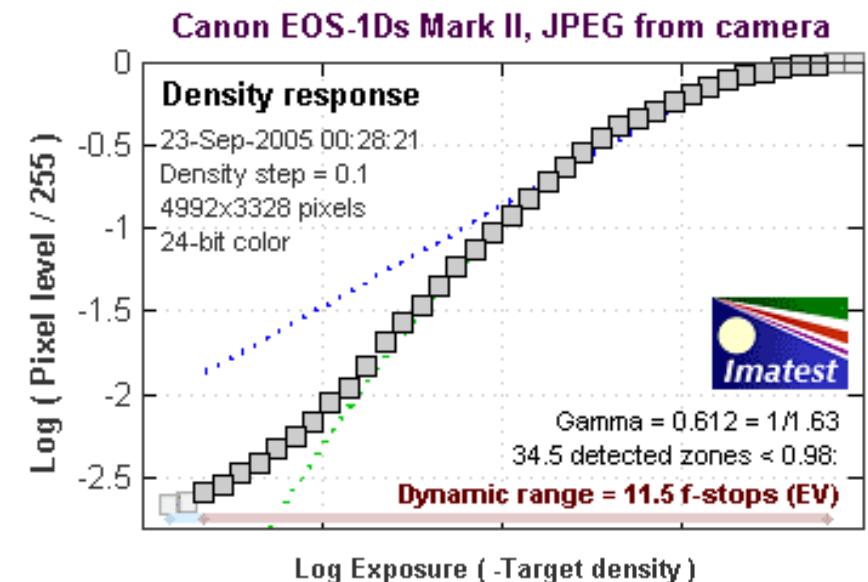

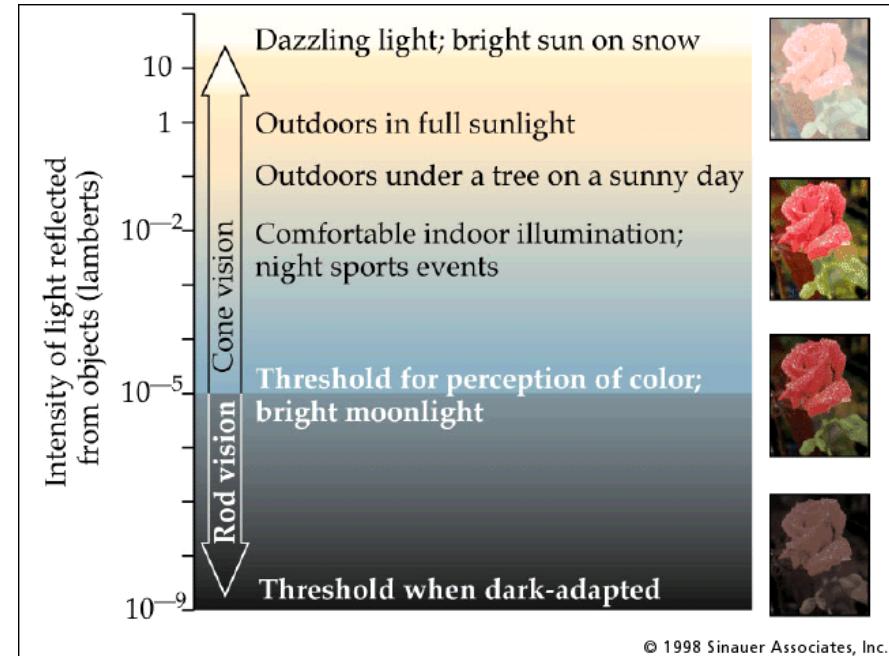

(the normal is a unit vector)

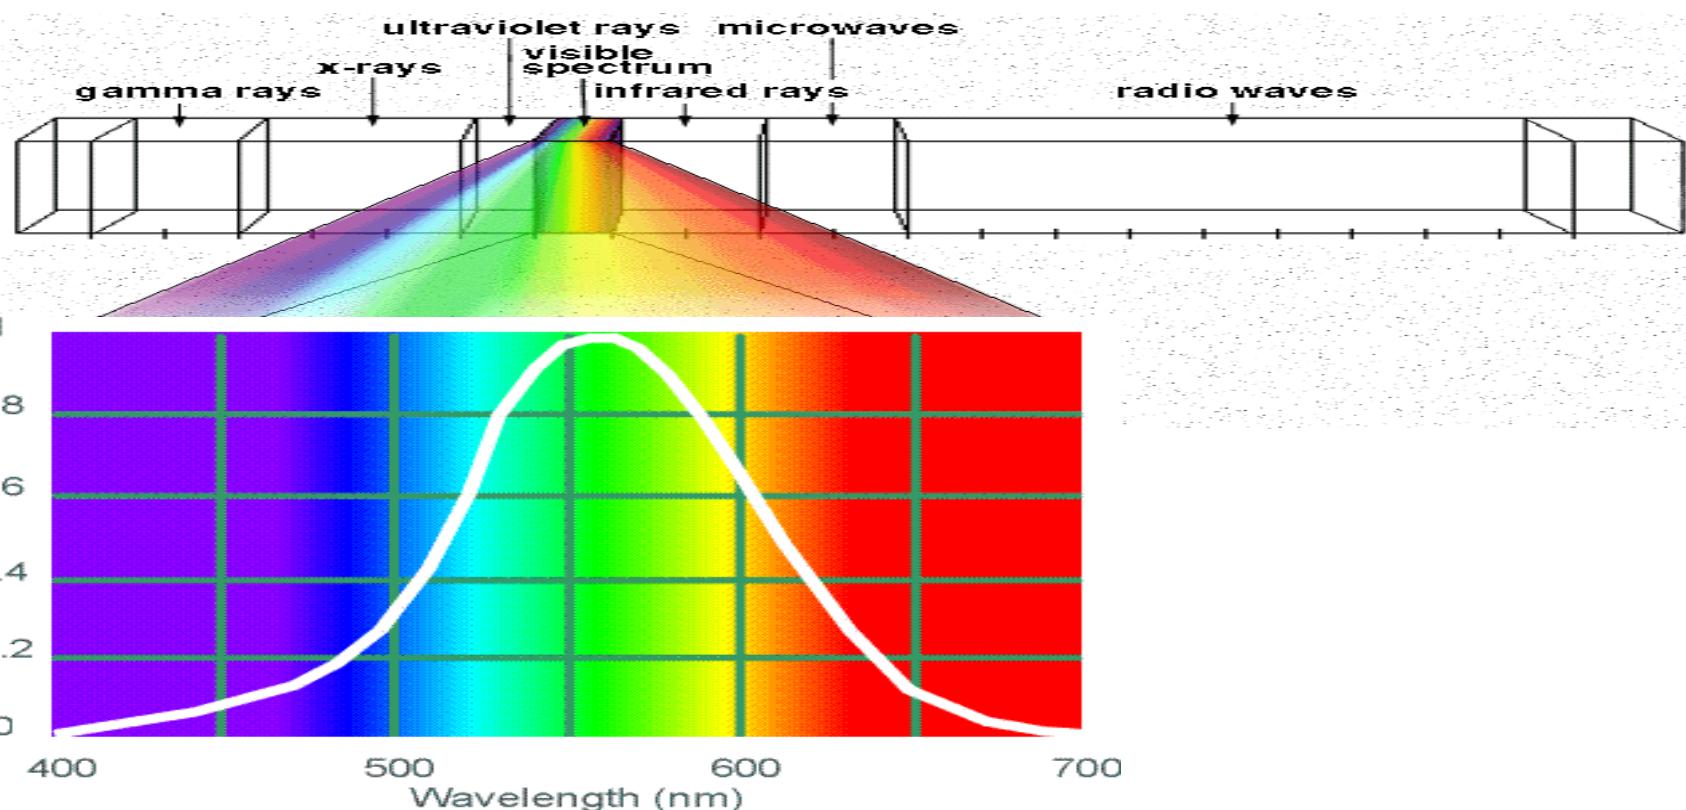

# Dynamic range and camera response

- Typical scenes have a huge dynamic range
- Camera response is roughly linear in the mid range (15 to 240) but non-linear at the extremes
  - called saturation or undersaturation

# Color

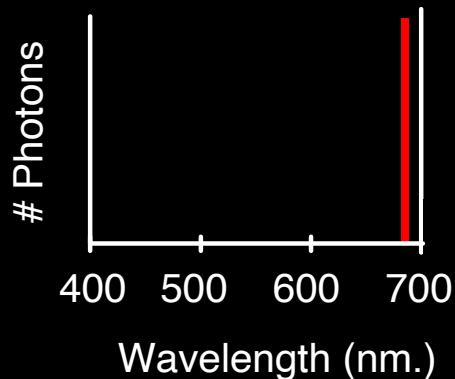

Light is composed of a spectrum of wavelengths

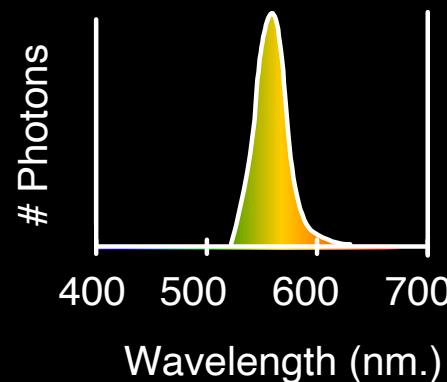

Human Luminance Sensitivity Function

# Some examples of the spectra of light sources

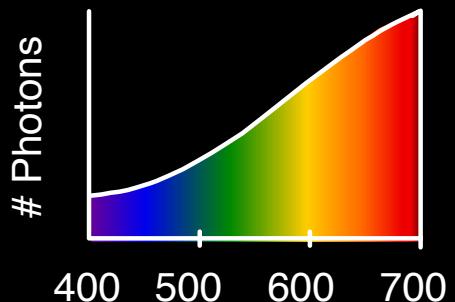

A. Ruby Laser

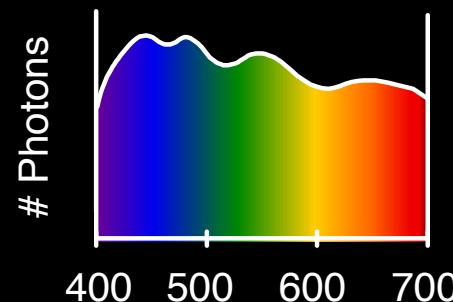

B. Gallium Phosphide Crystal

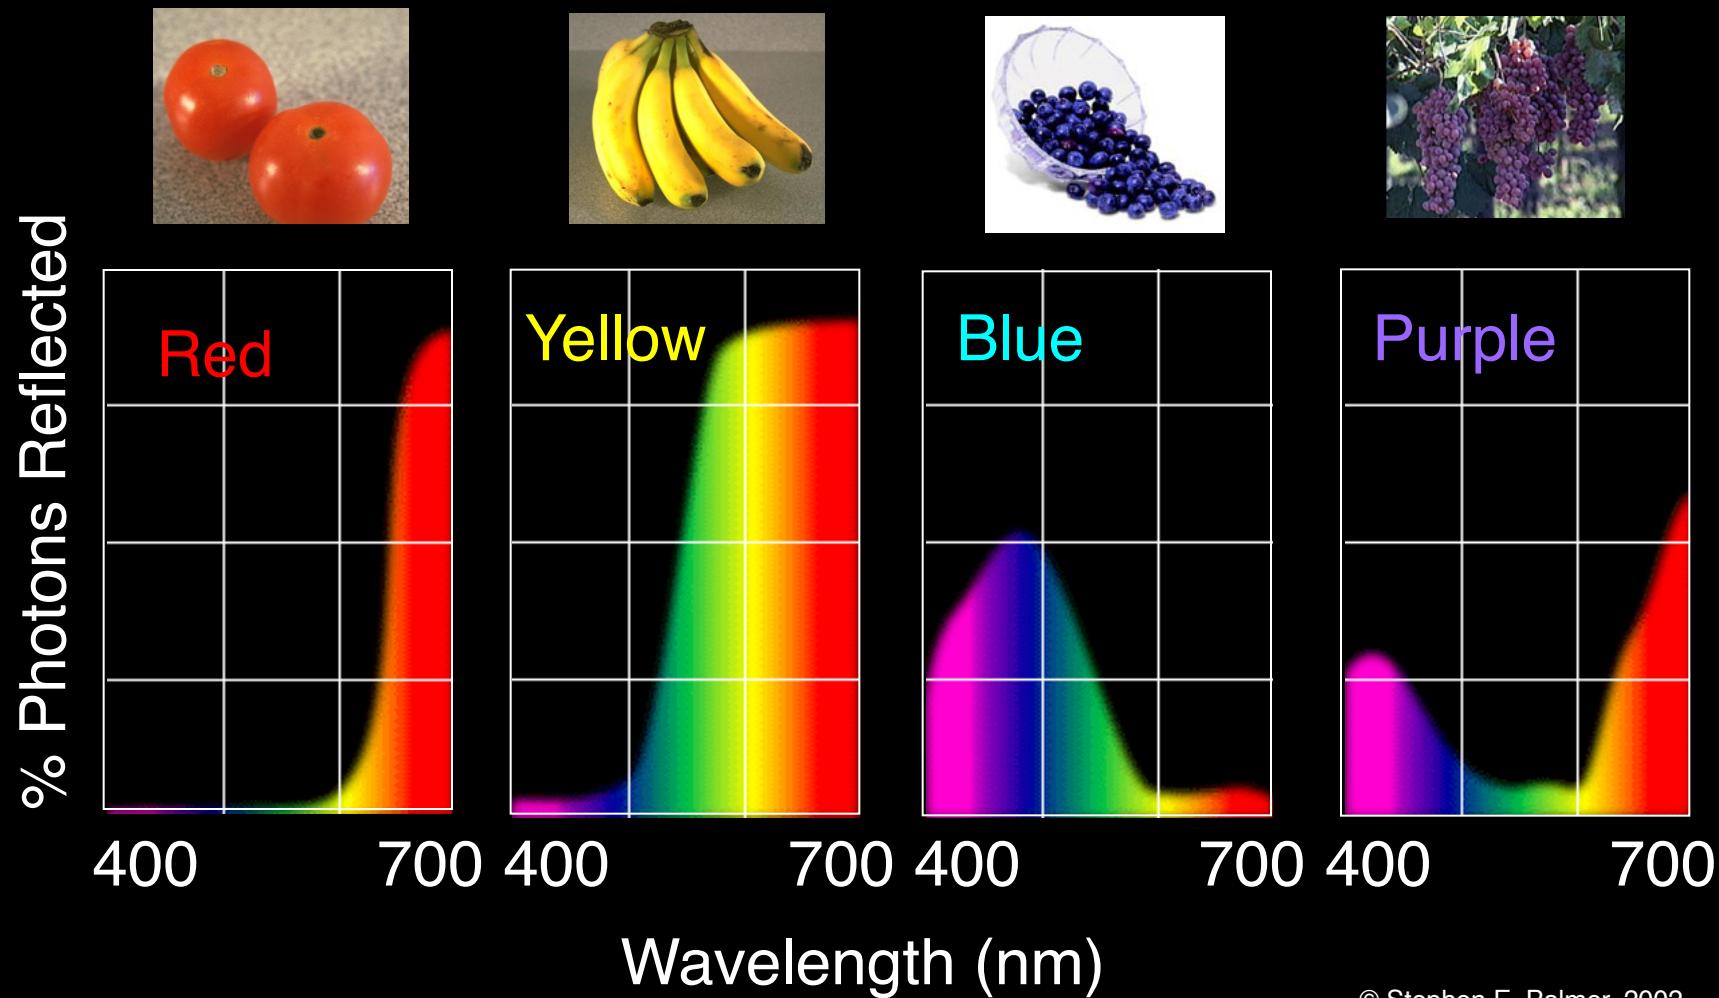

C. Tungsten Lightbulb

D. Normal Daylight

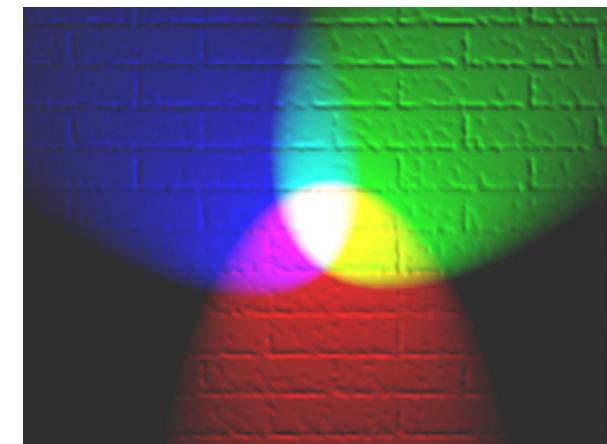

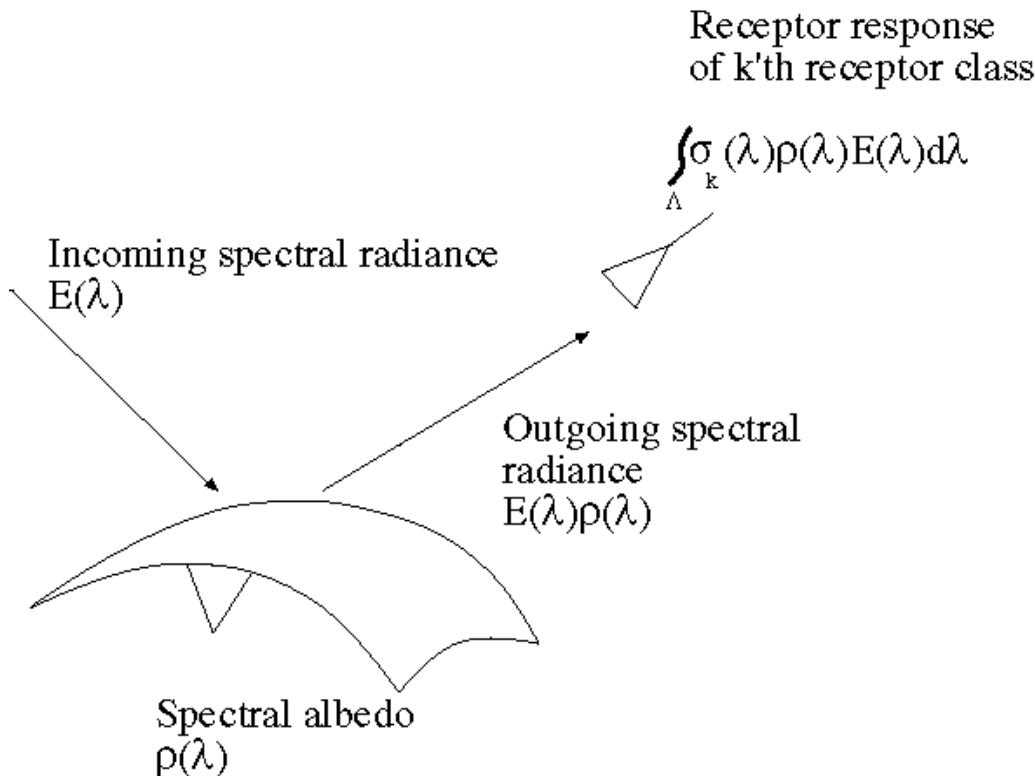

# Some examples of the reflectance spectra of surfaces

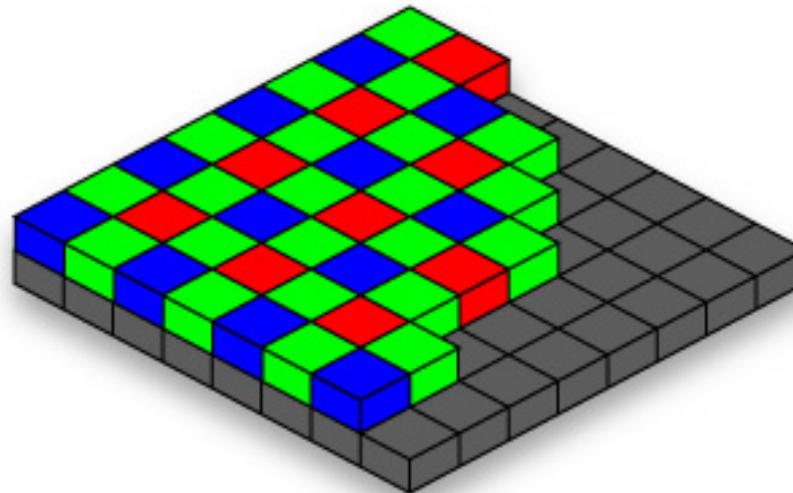

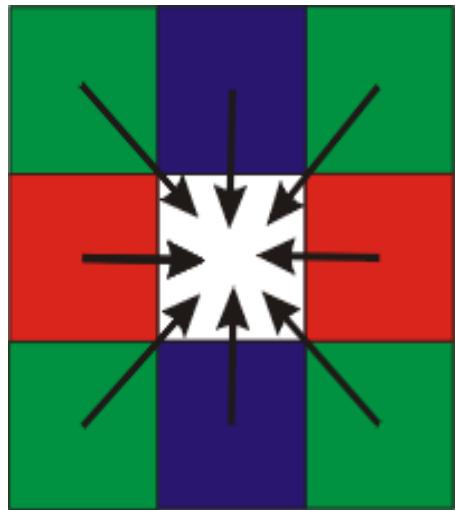

# The color of objects

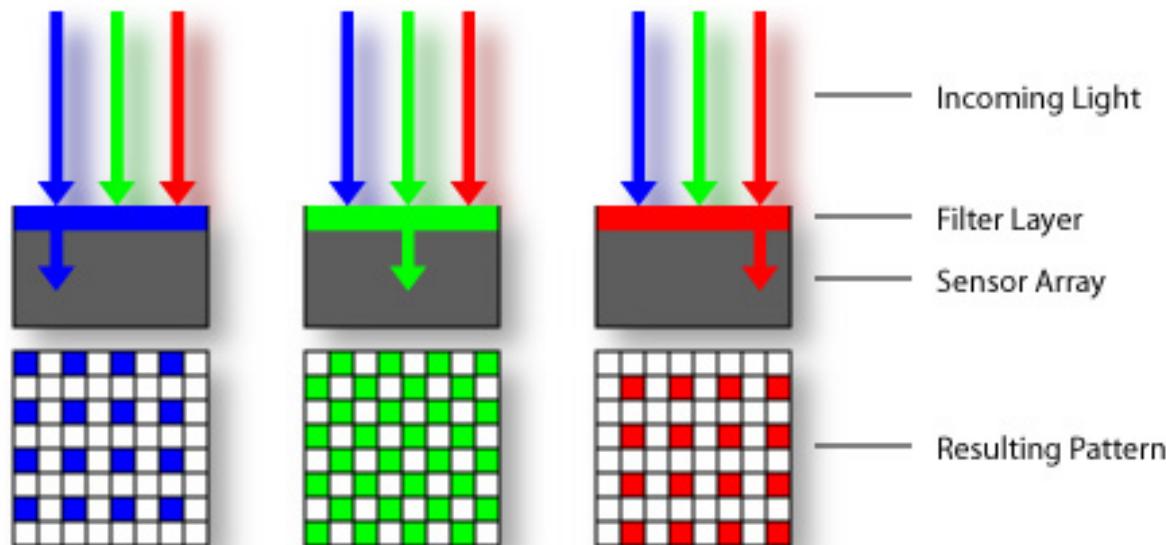

- Colored light arriving at the camera involves two effects
  - The color of the light source (illumination + inter-reflections)
  - The color of the surface

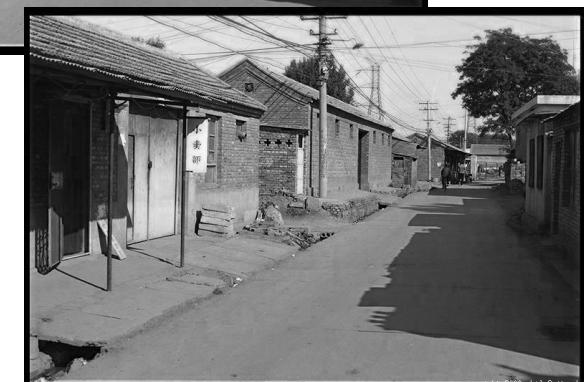

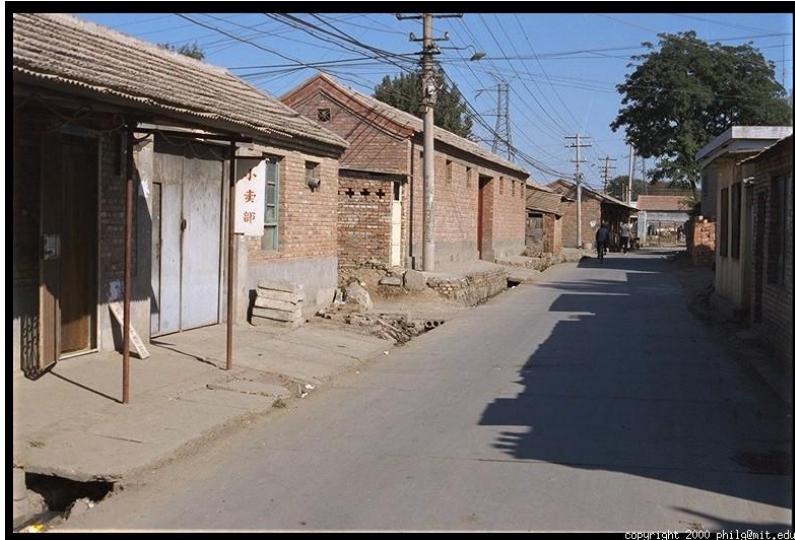

# Color Sensing: Bayer Grid

Estimate RGB at each cell from neighboring values

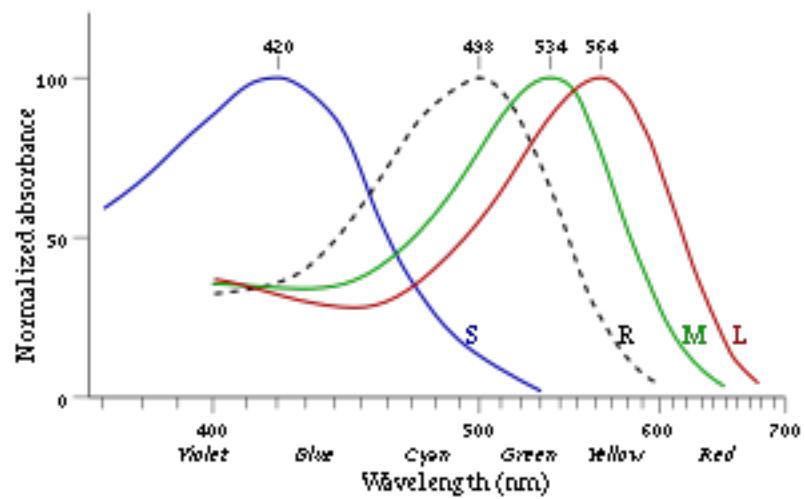

# Color Image

# Why RGB?

If light is a spectrum, why are images RGB?

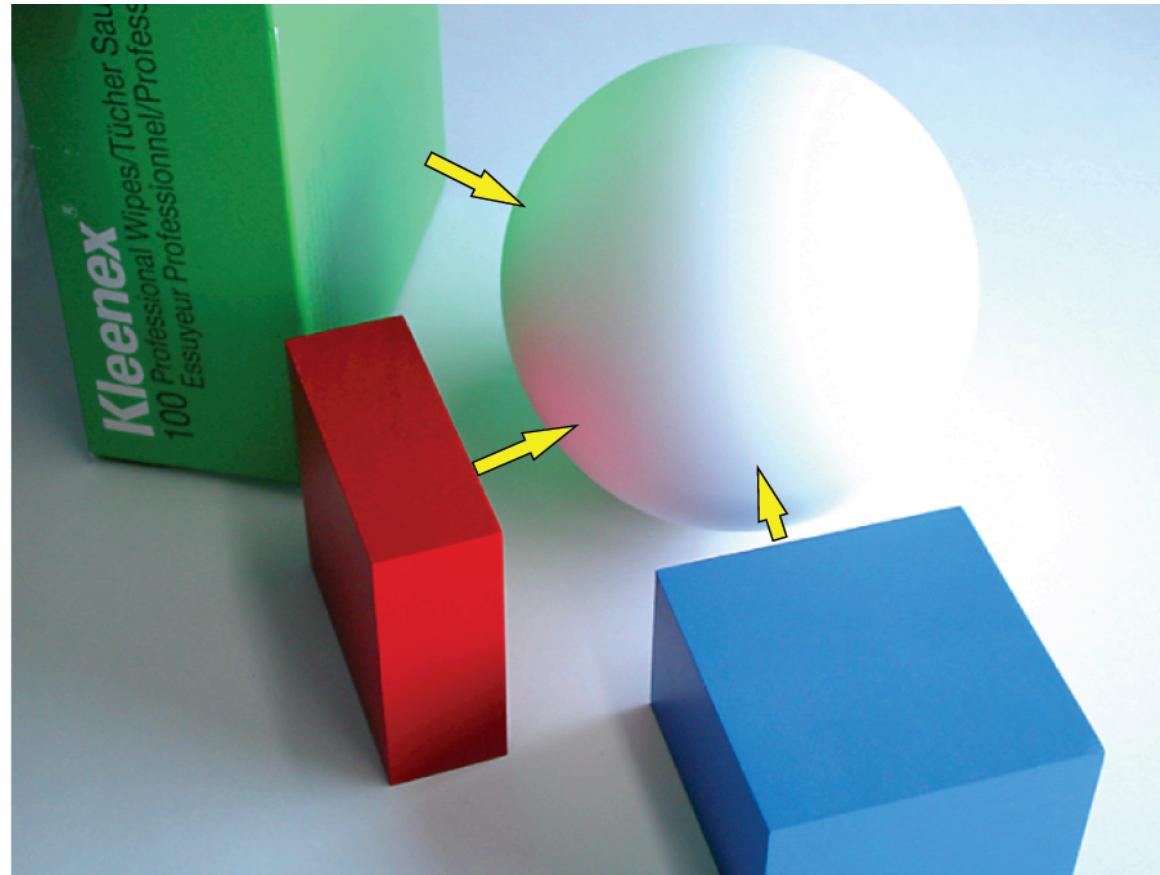

# Human color receptors

- Long (red), Medium (green), and Short (blue) cones, plus intensity rods
- Fun facts
  - “M” and “L” on the X-chromosome
    - That’s why men are more likely to be color blind (see what it’s like: <http://www.vischeck.com/vischeck/vischeckImage.php>)
  - “L” has high variation, so some women are tetrachromatic
  - Some animals have 1 (night animals), 2 (e.g., dogs), 4 (fish, birds), 5 (pigeons, some reptiles/amphibians), or even 12 (mantis shrimp) types of cones

# So far: light → surface → camera

- Called a local illumination model
- But much light comes from surrounding surfaces

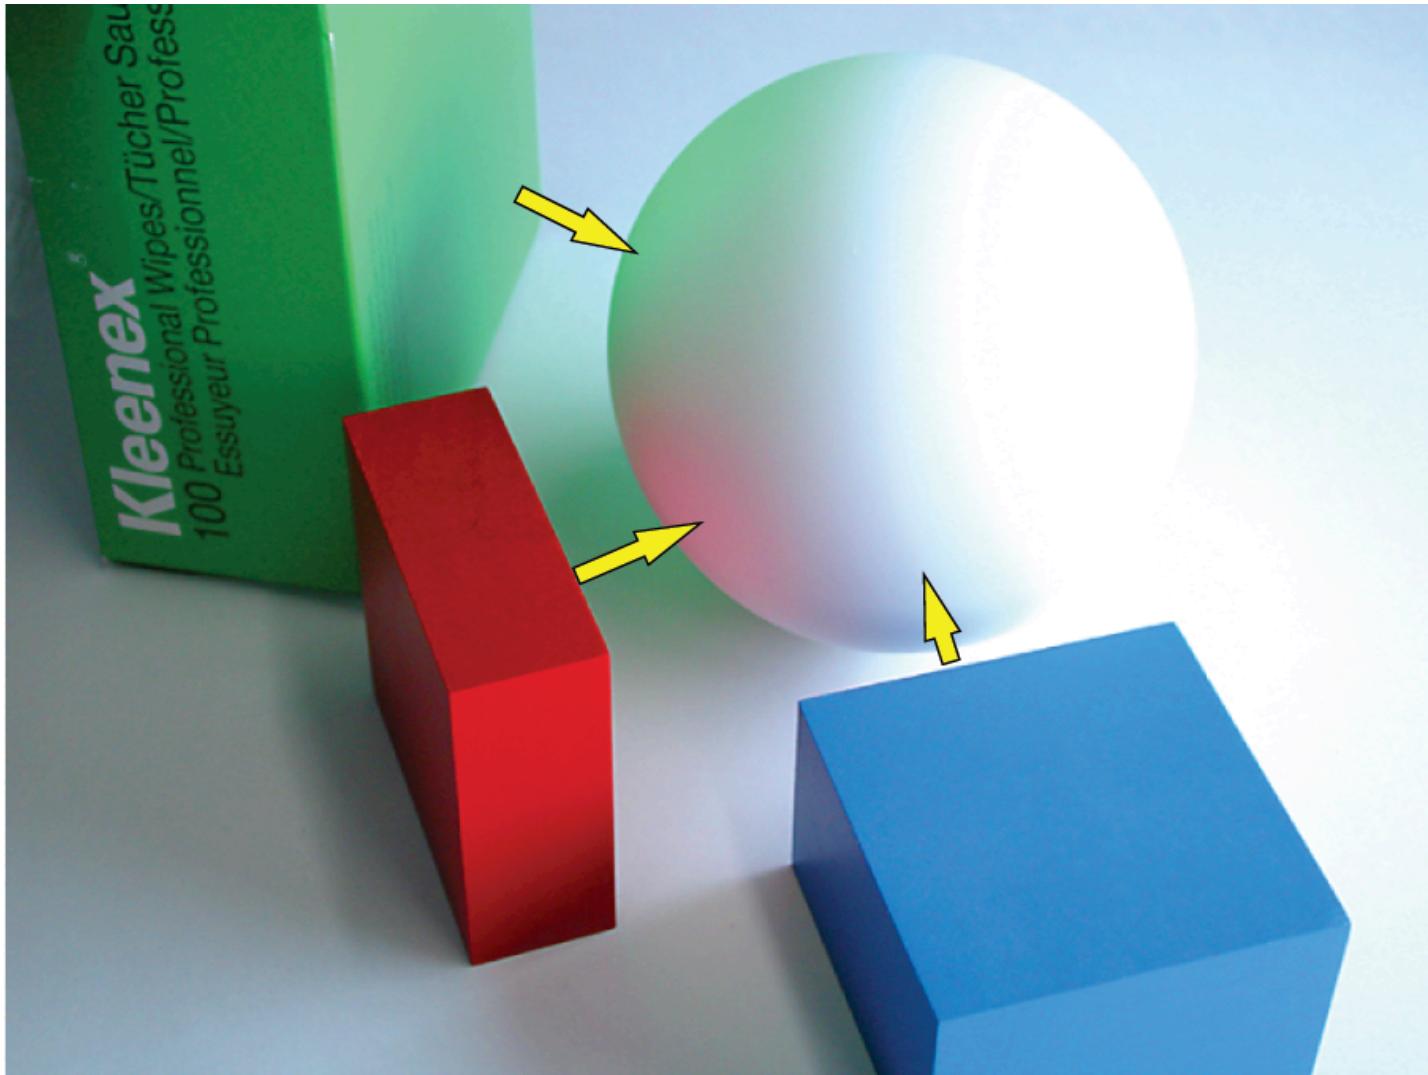

From Koenderink slides on image texture and the flow of light

# Inter-reflection is a major source of light

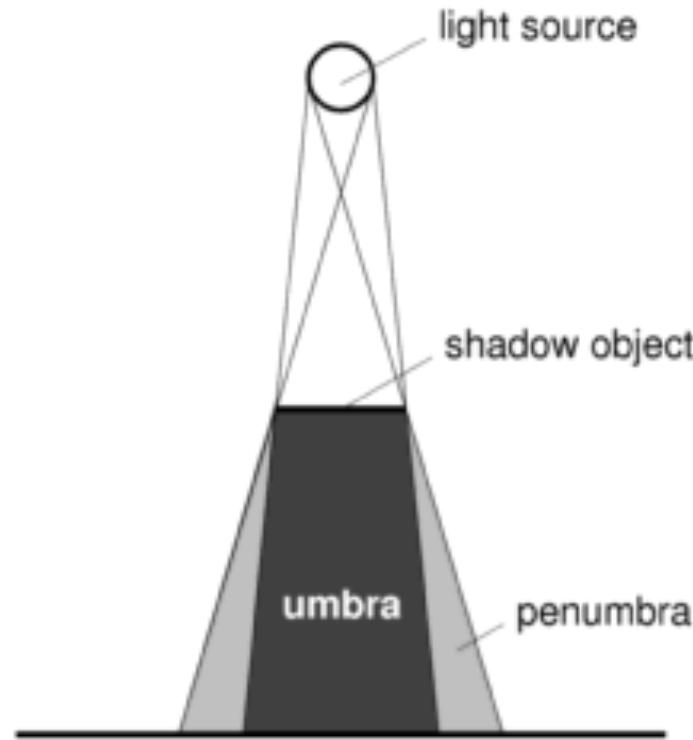

# Inter-reflection affects the apparent color of objects

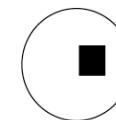

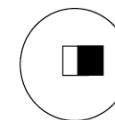

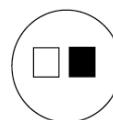

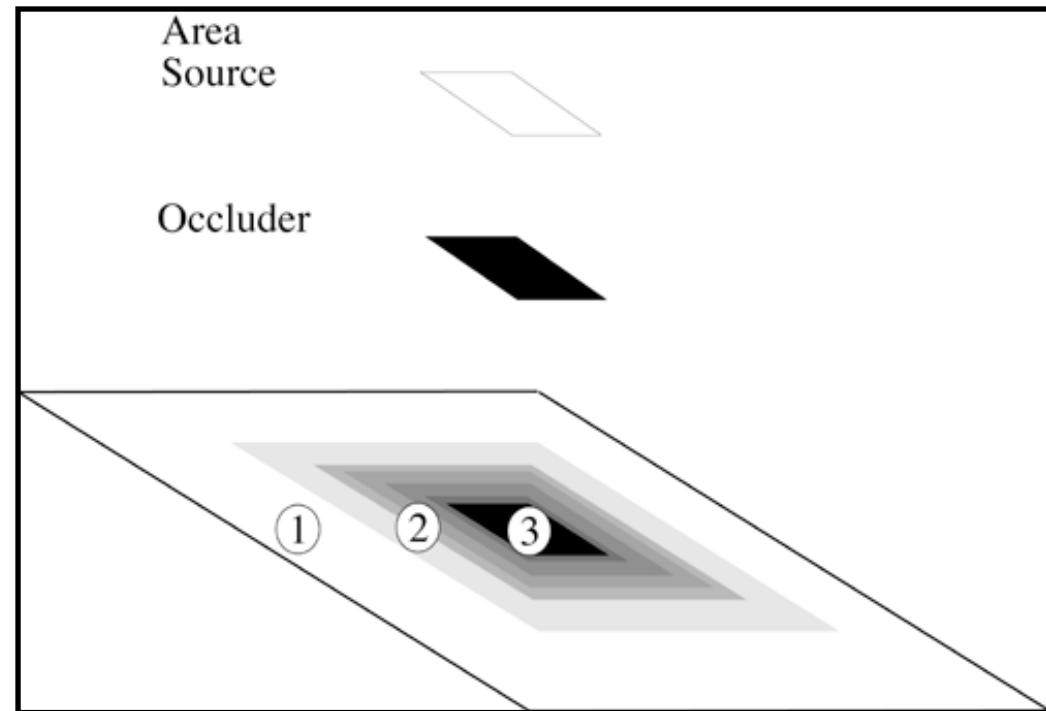

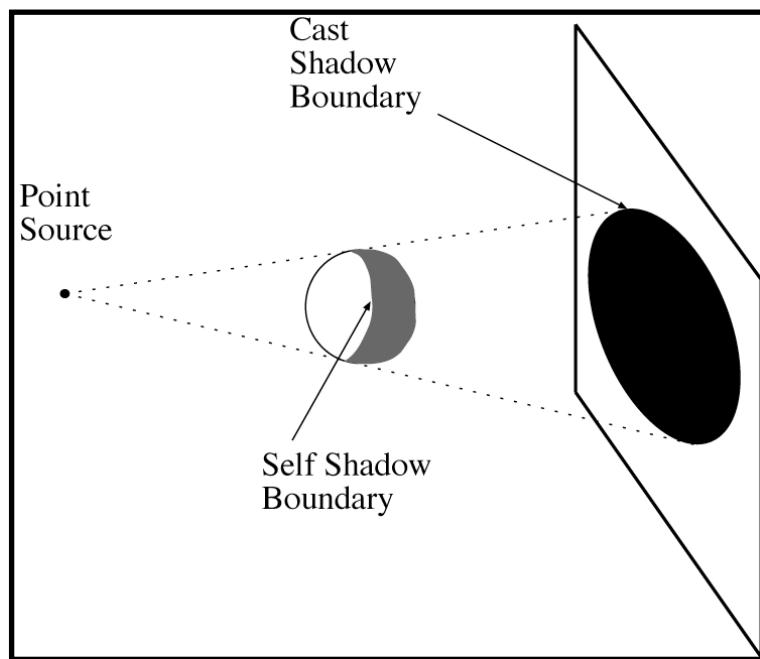

From Koenderink slides on image texture and the flow of light

# Scene surfaces also cause shadows

- Shadow: reduction in intensity due to a blocked source

# Shadows

1

2

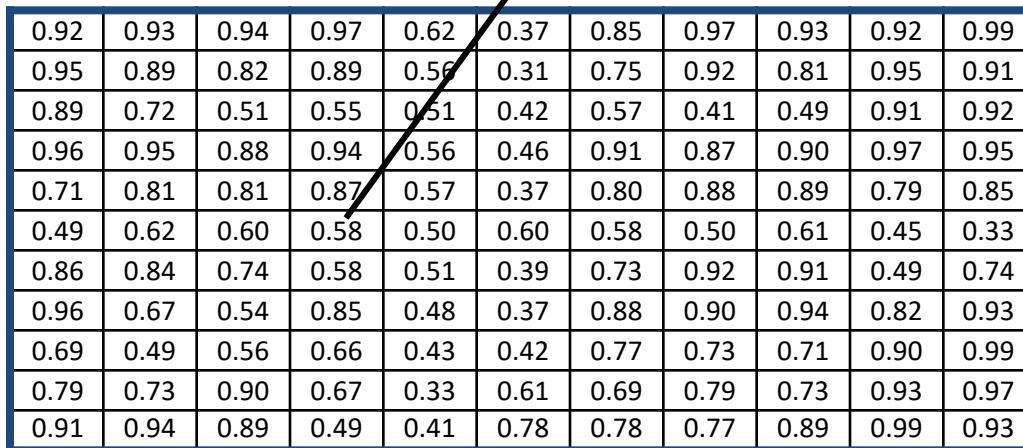

3

# Models of light sources

- Distant point source
  - One illumination direction
  - E.g., sun
- Area source
  - E.g., white walls, diffuse lamps, sky
- Ambient light
  - Substitute for dealing with interreflections
- Global illumination model
  - Account for interreflections in modeled scene

# What does the intensity of a pixel tell us?

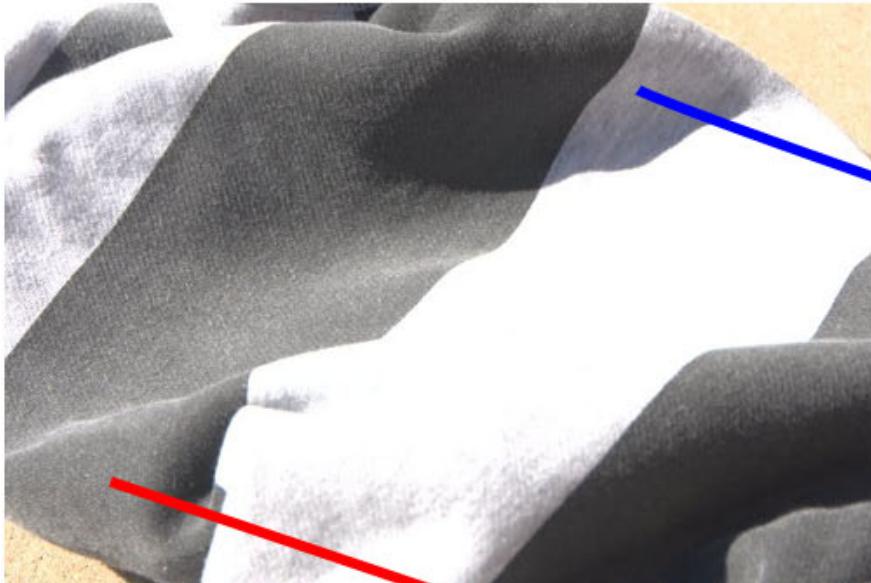

$$im(234, 452) = 0.58$$

# The plight of the poor pixel

- A pixel's brightness is determined by
  - Light source (strength, direction, color)
  - Surface orientation
  - Surface material and albedo
  - Reflected light and shadows from surrounding surfaces
  - Gain on the sensor
- A pixel's brightness tells us nothing by itself

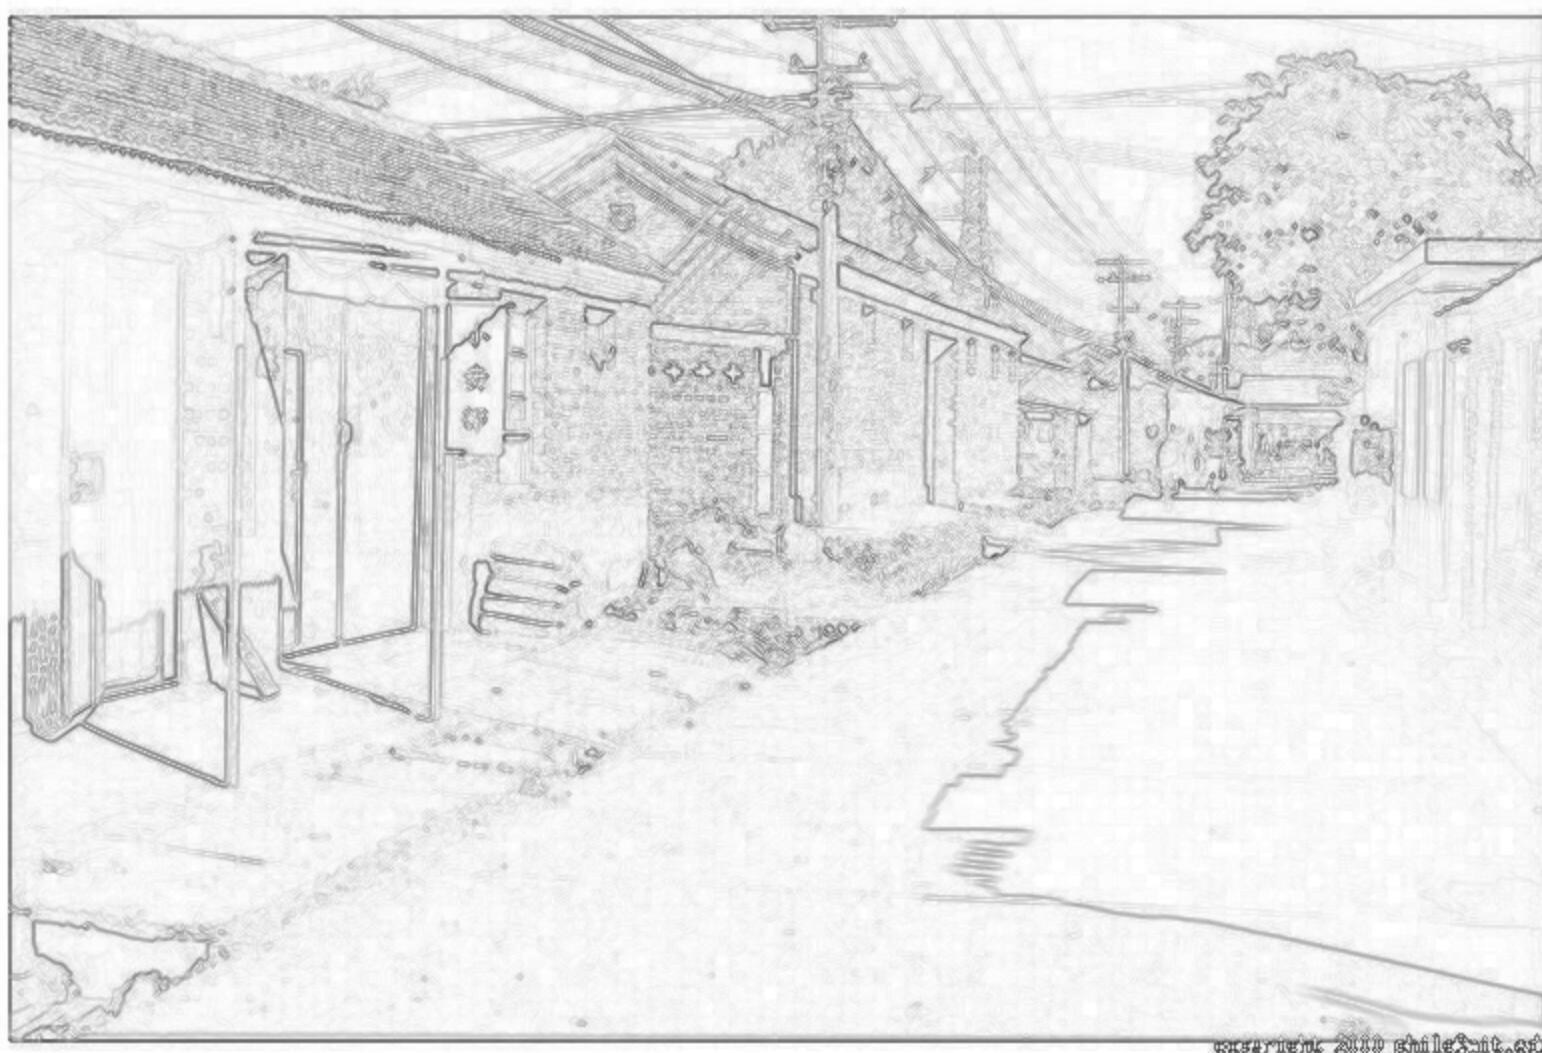

# And yet we can interpret images...

- Key idea: for nearby scene points, most factors do not change much
- The information is mainly contained in *local differences* of brightness

# Large Difference in Neighboring Pixels

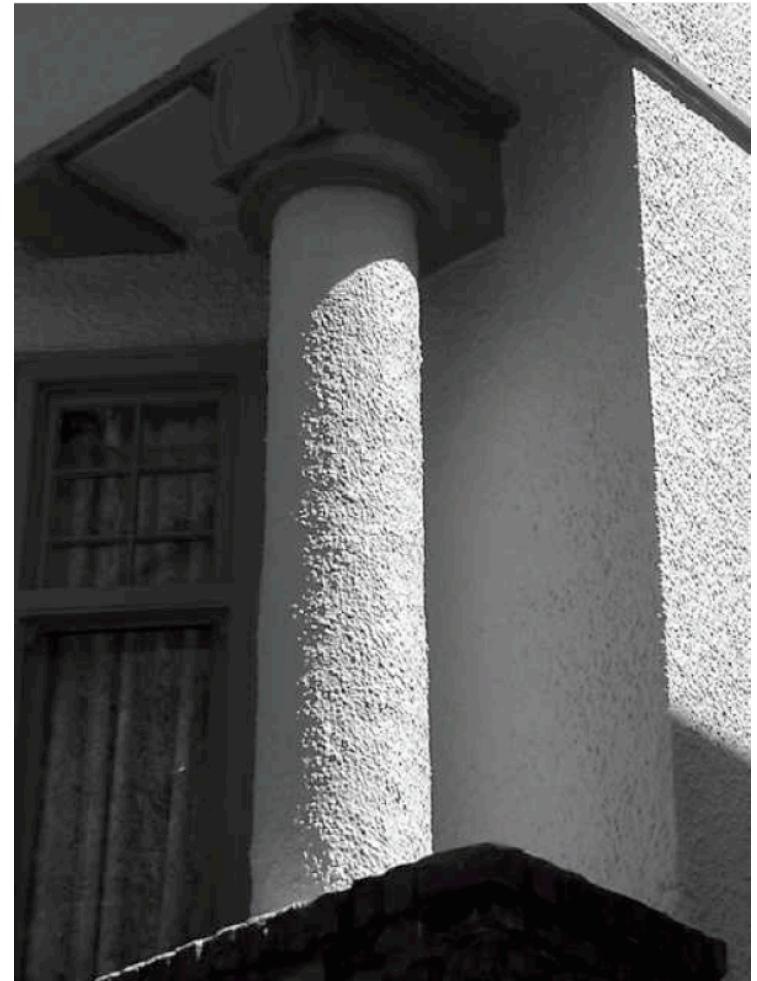

# What is this?

# What differences in intensity tell us about shape

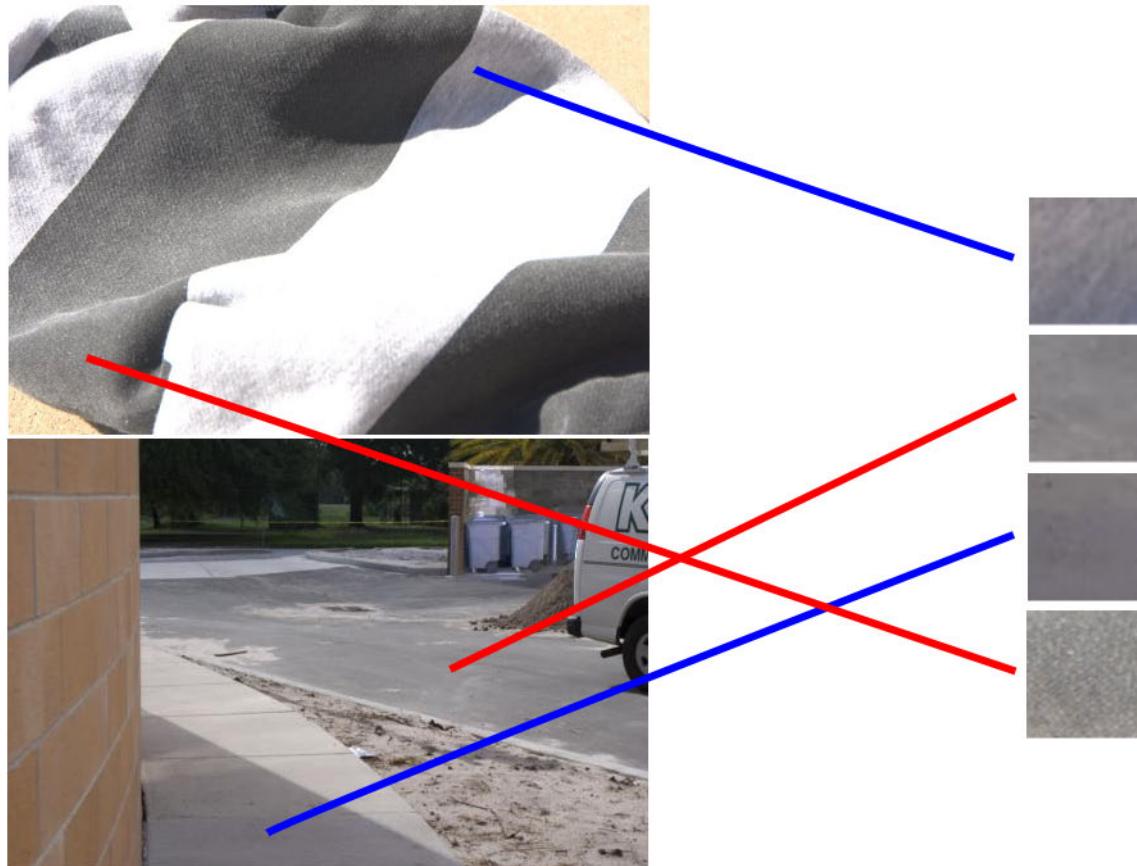

- Changes in surface normal
- Texture
- Proximity
- Indents and bumps
- Grooves and creases

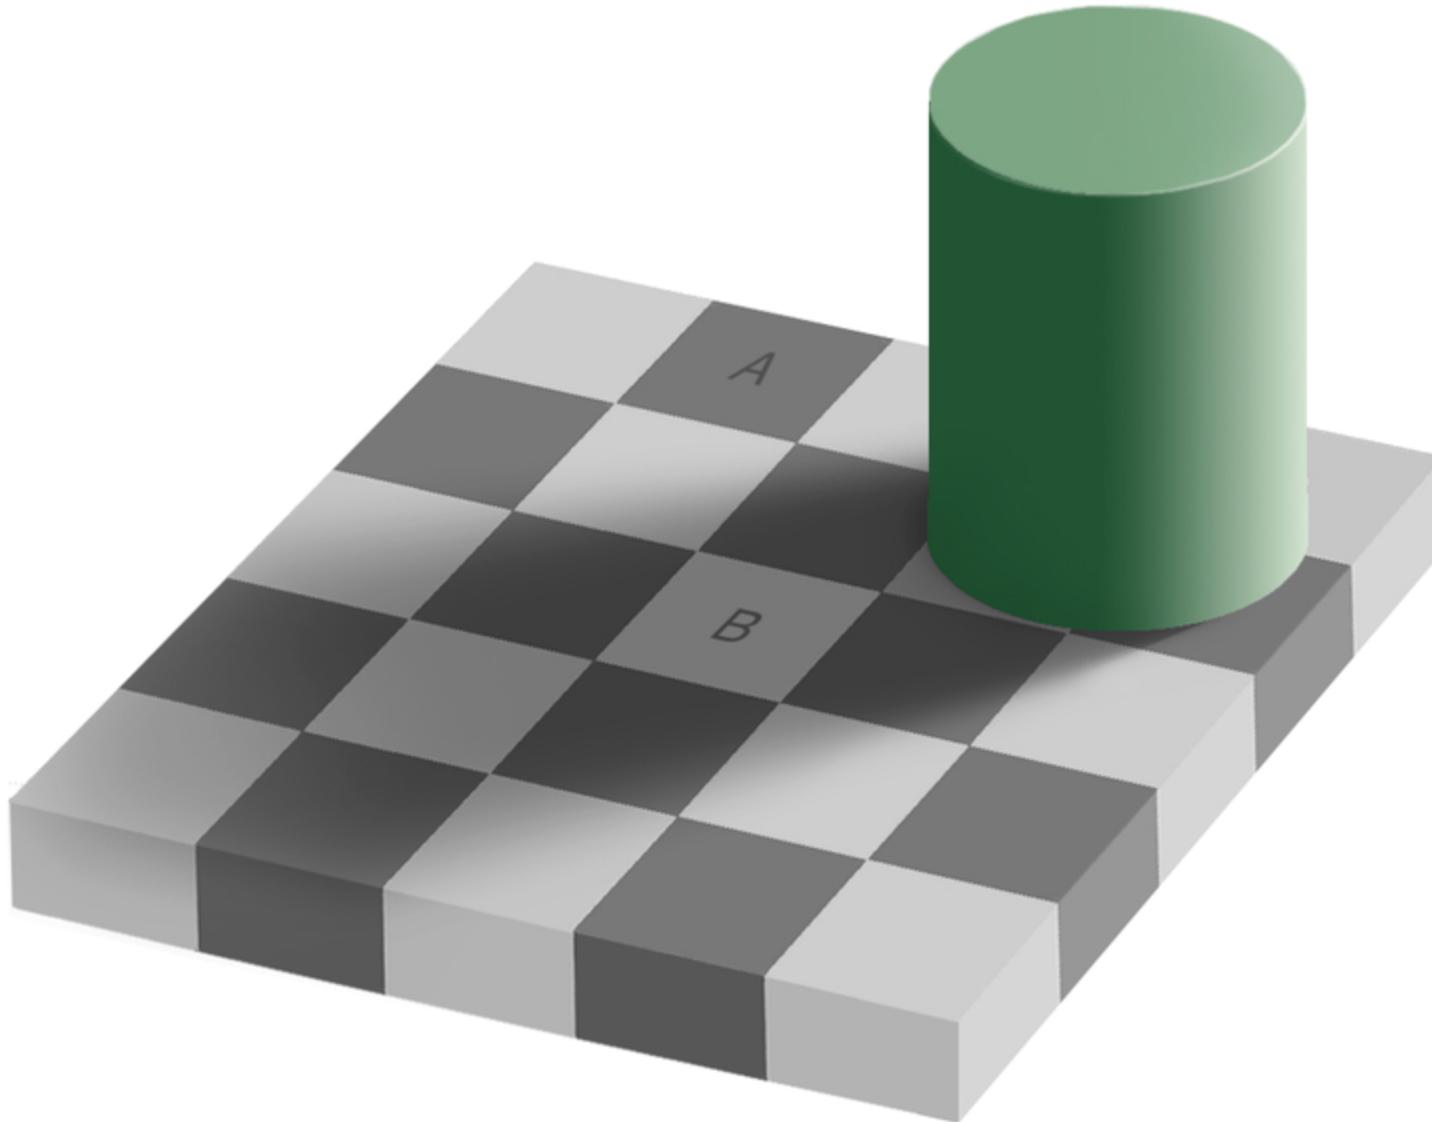

Photos Koenderink slides on image texture and the flow of light

# Color constancy

- Interpret surface in terms of albedo or “true color”, rather than observed intensity
  - Humans are good at it
  - Computers are not nearly as good

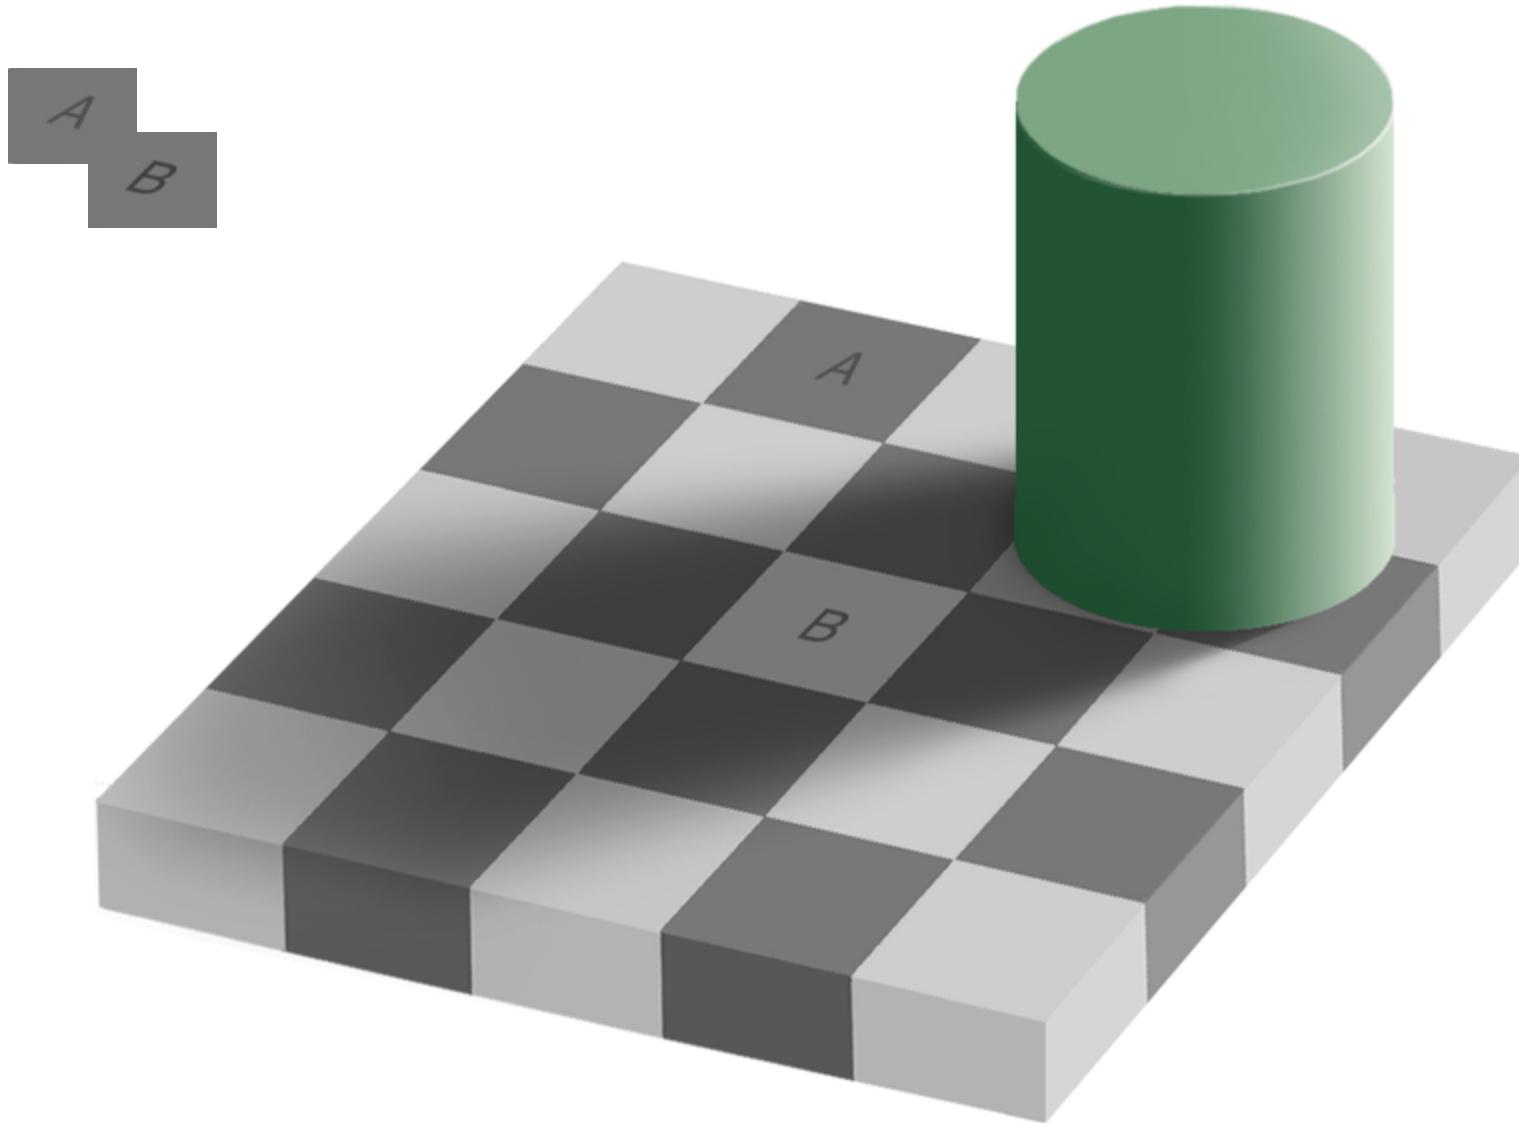

# Perception of Intensity

from Ted Adelson

# Perception of Intensity

from Ted Adelson

# Things to remember

- Important terms: diffuse/specular reflectance, albedo, umbra/penumbra
- Observed intensity depends on light sources, geometry/material of reflecting surface, surrounding objects, camera settings
- Objects cast light and shadows on each other
- Differences in intensity are primary cues for shape
